

McAfee Foundstone Enterprise

Proven, priority-based vulnerability management

Your organization faces a deluge of information about threats and vulnerabilities—the sheer volume of data makes it nearly impossible to determine which threats are critical and which are less relevant. Without an effective, priority-based risk management system, your organization will always be at risk.

McAfee® Foundstone® Enterprise is a vulnerability management solution that enables you to mitigate risk by carefully balancing asset value, vulnerability severity, and threat criticality. Your organization can then direct valuable IT resources where they will have the greatest return, thereby improving your overall security posture.

Key benefits

Priority-based approach to vulnerability management

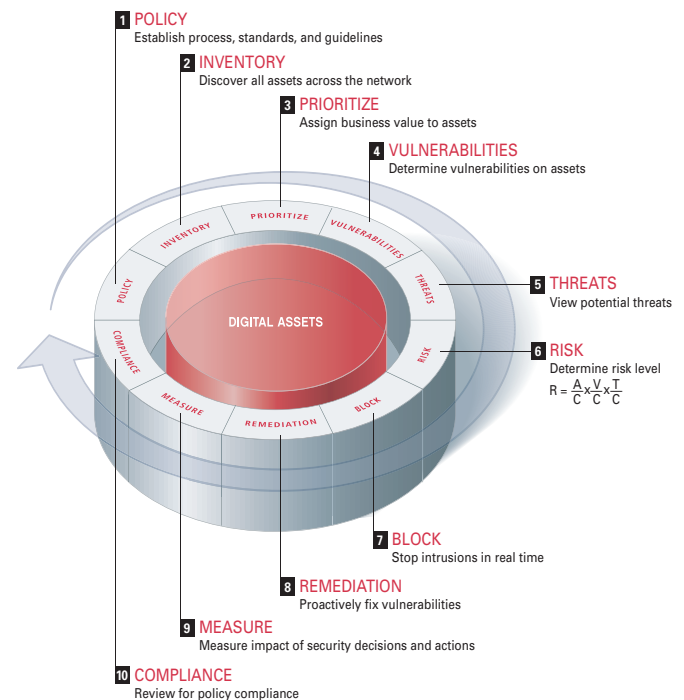

There are many potential exploits that threaten your organization's security. Maximize your scarce resources by focusing on the most critical assets and those vulnerabilities and threats that create the highest risk.

- Asset criticality labeling, pioneering security metrics, and other intuitive reporting features help measure your risk posture and communicate improvements based on objective decision-making processes
- Respond when and where it matters most, managing or eliminating threats before they affect business availability
- Instantly understand how new vulnerabilities or breaking threats affect existing risk mitigation priorities
- Replace the inefficient, time-consuming processes and stand-alone products that your organization uses to manage vulnerabilities with a single closed-loop system, giving your IT staff time back in their day
- Install the zero-maintenance FS850 remote scan engine appliance in seconds with no local IT expertise, freeing up IT staff to focus on eliminating risk

Take control of the vulnerability management life cycle

Foundstone Enterprise is a complete, appliance-based, plug-and-play solution for vulnerability management and risk mitigation. It automates, integrates, and simplifies the existing processes your organization already uses to reduce the risk of vulnerabilities. Foundstone Enterprise enables you to take immediate control of the entire vulnerability management life cycle:

- Discover and prioritize assets
- Pinpoint vulnerabilities
- Proactively address critical threats
- Conduct asset-based remediation management
- Measure and report compliance

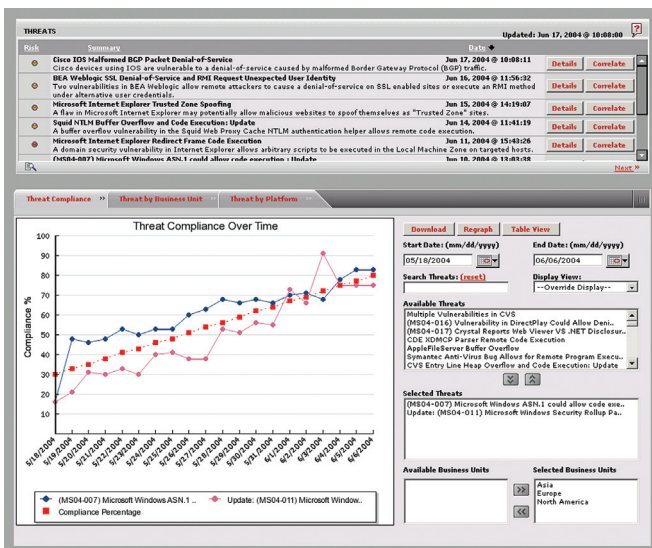

Foundstone Enterprise's priority-based approach gives you complete control over the vulnerability management life cycle.

Measure and manage threat mitigation

Foundstone's embedded security expertise and threat management tools reduce the reliance on in-house expertise, giving you the ability to quickly assess your security posture, benchmark business units or regions, and track the progress of implemented security policies and programs.

- Understand the risk to system and network resources with easy-to-understand metrics: FoundScore, MyFoundScore, and Risk Score
- Templates measure regulatory compliance with government or industry regulations, including BS7799, FISMA, HIPAA, and PCI
- Scales to Class A network
- Closed-loop remediation workflow system automatically opens and assigns tickets upon discovery of new vulnerabilities, and automatically verifies and closes them upon remediation
- Flexible user account system and granular role-based access policies give you the freedom you need to effectively manage any size organization
- Unmatched threat visibility delivers regular, in-depth discovery and analysis of the full spectrum of vulnerabilities and misconfigurations on all devices

Threat Compliance View gives you up-to-the-minute alerts on breaking threats and measures compliance by threat, business unit, and platform.

Foundstone FS850

- Remotely managed, zero-maintenance scan engine
- Dual Intel XEON Pentium 4, 2.8 GHz processors
- 2GB ECC DDR-2 SDRAM
- 73 GB 10,000 RPM SCSI HDD
- Four 10/100/1000 Mb/s auto-sensing Ethernet interfaces

Foundstone FS1000

- Scan engine, database, and manager
- Dual Intel XEON Pentium 4 2.8 GHz processors
- 2 GB of RAM
- 143 GB fault-tolerant SCSI HDD
- Dual 10/100/1000 Mb/s auto-sensing Ethernet interfaces

Secure, hardened appliances

McAfee Foundstone offers enterprise-class scalability in secure, cost-effective appliances. They deliver unmatched protection and performance with minimal effort. Foundstone Update Service automatically applies the latest application updates (including MS-SQL) and OS patches, eliminating the need for end-user maintenance.

The Foundstone FS850 appliance is a totally automated, zero-maintenance, remotely managed scan engine, fully managed by the FS1000 appliance. The FS850's simple three-step installation process and remote management makes it an ideal choice for large enterprises and service providers.

The Foundstone FS1000 appliance is a secure, high-performance system that can be installed and fully operational within minutes. It is the most complete, accurate, and scalable vulnerability management appliance on the market today.
